Royal College of Anaesthetists

Reducing the carbon footprint of anaesthetic gasses

Dr JMT Pierce
Environment and Sustainability Advisor
Royal College of Anaesthetists (UK)

University Hospital Southampton, UK

Overview

- Review of anaesthesia
- Atmospheric science
- Review of the agents used for inhalational anaesthesia
- Tools that might help reduce the CO_2e
- Administrative components

Practical components of anaesthesia

Sedation analgesia and relaxation

RCoA
Royal College of Anaesthetists

Practical components of anaesthesia

Maintenance of homeostasis

Vascular access

Monitoring

Cardiovascular and respiratory control

Temperature control

Royal College of Anaesthetists

Fate of all of these components

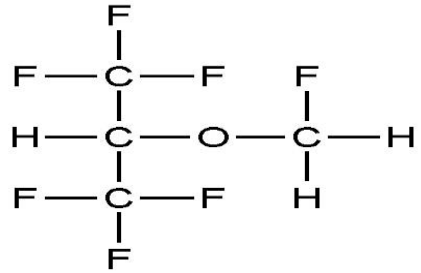
- Disposables
  - Combustion
- Intravenous drugs
  - Metabolised
  - Unused residue combusted
- Packaging
  - Recycled
- Inhalational agents
  - Exhaled into the atmosphere unchanged

Combustion of1kg PVC produces 3kg CO_2

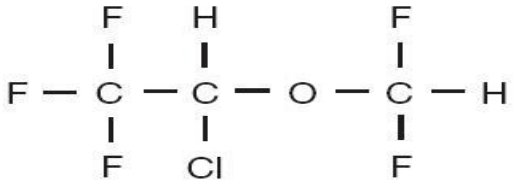
Combustion of 1kg paper 2.1-2.6 kg CO_2

RCoA
Royal College of Anaesthetists

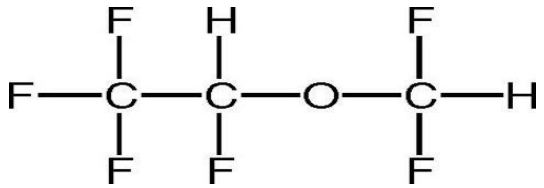
Inhalational anaesthetic agents



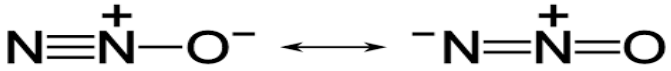
Sevoflurane
GWP 130
Bottle (250ml) 44kg CO_2e



Isoflurane
GWP 510
Bottle (250 ml)190 kg CO_2e



Desflurane
GWP 2540
Bottle (240 ml) 886 kg CO_2e



Nitrous oxide
GWP 310
Cylinder (3.4 kg) 1054 kg CO_2e

RCoA
Royal College of Anaesthetists

Peculiar aspects of inhalational anaesthesia

- Volatile substituted ethers
- Liquids at room temperature
- Vapourised and added to the anaesthetic breathing circuit in a concentration from 1-8%
- Carrier gas mixture is oxygen/air or oxygen/N_2O 30%/70%
- Depth of anaesthesia depends on the exhaled partial pressure (concentration)
- Exhaled unchanged recycled via CO_2 absorber and/or scavenged into the atmosphere
- Most of the CO_2e of procurement is in disposal of the agent

ET Isoflurane

Fresh gas flow

Patient gas supply

Royal College of Anaesthetists

Scope for choice in anaesthesia

- General anaesthesia vs regional anaesthesia
- Carrier gas oxygen enriched air or O_2/N_2O
- Inhalational agents
  - The type
  - The fresh gas flow "low flow anaesthesia"
  - Added intravenous analgesics or sedatives

Carbon Footprint update for NHS in England 2012

Appendix 1 – Overview of major changes for the 2012 update

To maintain alignment with the latest methods and information available a number of changes have been included in the 2012 update:

Update	2012 ($MtCO_2e$)	%
Healthcare services commissioned from outside the NHS are now included	2.3	9%
Carbon intensity factors for goods and services updated	0.9	4%
Meter Dose Inhalers (MDIs) now included	1.4	6%
Anaesthetic gases now included	0.6	2%
Total	5.2	21%

Carbon Footprint from Anaesthetic gas use

Conclusion

These results give total emissions for anaesthetic gases including Nitrous Oxide of an additional 2.5% (0.56 $MtCO_2e$) of NHS carbon footprint for England.

The majority of anaesthesia is in an acute setting. This is 5% of organisation footprint of acute organisations[18] (0.56 $MtCO_2e$ of 10.4 $MtCO_2e$). For acute organisations this is comparable with half the emissions from gas used for building energy use[19] (1.17 $MtCO_2e$) and would add around 15% to 25% on the building energy use carbon footprint (2.47 $MtCO_2e$)

Measuring, monitoring and reporting carbon dioxide equivalent emissions, from inhaled anaesthetics, is crucial for reducing emissions.

Manufacture of Medicinal Gases

32. Cylinders that have been returned for refilling should be prepared with care in order to minimise the risks of contamination, in line with the procedures defined in the Marketing Authorisation. These procedures, which should include evacuation and/or purging operations, should be validated.

Calculating the CO_2e of anaesthetics

Nitrous oxide cylinders

- Cylinder return data
- Cylinder volumes and temperature
  - Cylinders expressed in terms of numbers of litres of uncompressed gas at 15C
- Universal gas equation number of moles (PV=nRT)
- MWt N_20 44; calculate the mass of nitrous oxide
- GWP = 310

Entonox®

- 50:50 nitrous oxide : oxygen

Inhalational agents

- Number of bottles x volume x density x GWP

Accounting for the change of CO_2e

Less general anaesthesia and more regional and local anaesthesia

Move away from nitrous oxide/oxygen to oxygen enriched air

Low flow anaesthesia

- Lower fresh gas flow
- Greater intraoperative recycling of exhaled agents
- Less wastage

Still a residual use of nitrous oxide

RCoA
Royal College of Anaesthetists

Annual data

- Way of plotting trends
- Historical data
- Not contemporaneous
- Unlikely that it will change behaviour

Royal College of Anaesthetists

Real time CO_2e calculator

- Know the fresh gas flow (litres per min) and the vapouriser setting (%)
- Assume that inhaled agent behaves as ideal gas
- Know the temperature and the GWP of each agent
- Calculate the mass of agent used from the volume
- Mass used x GWP = CO_2e
- Know the unit cost then calculate the cost per hour of the inhalational component of anaesthesia

Administrative components

Protecting resources, promoting value:
a doctor's guide to cutting waste in clinical care

November 2014

Guidelines for the Provision of Anaesthesia Services

- Work with estates to minimise energy use
  - Including AGSS and OR ventilation and lighting
- Reduce resource use
  - Low flow anaesthesia
    - Avoid nitrous oxide within reason
    - Desflurane low flow as a matter of course
    - TIVA
  - Minimise drug and disposable wastage
- Recycling to avoid combustion of waste or landfill

Choosing Wisely

1. **Day surgery** should be considered the default for most surgical procedures (except complex procedures)

2. Patients do **not need to come into hospital the day before surgery** if they have had the appropriate preoperative assessment and preparation

3. Most patients **do not need routine preoperative tests** before minor or intermediate surgery.

4. For many patients the chance of harm after an operation may be reduced if they **improve fitness, stop smoking, reduce alcohol intake** and in some cases **reduce weight** in the weeks or months before their surgery.

RCoA
Royal College of Anaesthetists

Summary

- The overall impact of anaesthesia is small on a global scale compared with other GHGs
- The proportion of the CO_2e health care delivery attributable to anaesthesia is significant
- There is scope for informed choices of practice
- Reducing or eliminating the use of nitrous oxide is the largest single contribution one can make
- The Impact Calculator can help with those choices
- Need systems and processes in place
